

ABSTRACT OF THE DISCLOSURE

SAMPLE-TAKING DEVICE

5 A rotating plug (4) is installed in a body (1) and  
can be in different positions in which two lateral  
drillings come in front of the orifices corresponding  
to the body (1) or a sampling orifice (18) in front of  
10 which a flask is placed. The fluid to be sampled is  
circulated so that it fills a chamber (12) delimited by  
the rotating plug (4), and the rotating plug is then  
turned until one of its drillings is facing the  
sampling orifice (18) and a piston (11) delimiting the  
15 chamber (12) is pushed in to extract the required  
quantity of the sample. This device is simple and has  
an excellent seal.
